Gidravlicheskiye oborudovaniye metallovezhushchikh stankov;
posobiye dlya slesarey-remontnikov (Hydraulic Equipment of Metal-cutting Machine Tools; a Manual for Repairmen) 2d. ed., enl.
Moscow, Mashgiz, 1958. 169 p. 10,000 copies printed.

Reviewer: M. A. Tolstov, Engineer; Ed.: M.I. Lioznyanskiy, Engineer;
Tech Ed.: N.P. Yermakov; Exec. Ed. (Ural-Sibirian Division,
Mashgiz): L.A. Kon'shina.

PURPOSE: This textbook is intended for mechanics, machine shop foremen, and machine-tool operators.

COVERAGE: This book was written to comply with the program of courses designed to raise the qualifications of personnel repairing metal-cutting machines. The author presents basic information on hydraulics, describes the working principles and operation of hydraulic drives of modern metal-cutting machines, discusses overhauling and adjustment of individual hydraulic assemblies, and basic design. Engineers M.I. Lioznyanskiy and M.A. Tolstoy contributed to this

AUTHOR: Sil'chenko, T.S.

TITLE: A Device for the Machining of Spherical Surfaces

PERIODICAL: Stanki i Instrument, 1960, No. 9, pp. 38 - 39

TEXT. The author describes a device for the machining of spherical surfaces which was developed at the Voronezhskiy zavod imeni Kalinina (Voronezh Plant im. Kalinin) for the machining of rods of mechanical presses, having spherical heads of 400 mm in diameter. The circular motion of the cutting tool is effected by way of mechanical feed of the cross slide. In order to fit the device on the lathe, compound rest and tool post are removed, and the device, consisting of a toothed wheel and rack gear, is fastened on the lateral surface of the cross slide. The author gives a description of the operation of the device and points out that owing to the mechanical feed, the tool circles evenly, which results in a correct geometric shape of the spherical surface with a finish of the 6th or 7th class. If a 7th - 8th class finish is required, a grinding head is used equipped with a cup-shaped grinding disk. The author points out that also concave spherical surfaces can be machined. There are 3 figures.

The microbiological and epidemiological characteristics of dysentery produced by Newcastle bacteria

Periodical : Zhur. mikro. epid. i immun. No 2, 64-68, Feb 1955

Abstract : Investigation of 96 strains of dysentery bacteria showed that all of them closely resembled Boyd-88 strains and strains that had been isolated earlier in Moscow. In accordance with the new USSR classification, they have been identified as belonging to the Newcastle subspecies of B. Dysenteriae Flexner. A high percentage of erroneous diagnoses (40.2%) had been made in cases of infection with Newcastle bacteria. Two tables.

TITLE: Use of the electron paramagnetic resonance for the selection of extremely sensitive working conditions of a setup for the measurement of dielectric losses by the method of grid currents

PERIODICAL: Referativnyy zhurnal, Fizika, no. 3, 1963, 41, abstract 3Zh243
("Uch. zap. Khar'kovsk. un-t", 1962, v. 121, Tr. Radiofiz. fak., v. 5, 145 - 150)

TEXT: A device for the measurement of small variations of the dielectric losses at frequencies of about 25 Mc is described. The operation of the device is based on the dependence of the constant component of the generator grid current on the loading impedance in the grid circuit. The value of the equivalent loading impedance varies in the presence or in the case of variation of losses in the sample of the dielectric introduced into the coil of the generator circuit. Maximum sensitivity of the given measuring generator is reached at definite working conditions of the valve, and at a definite ratio between the

Card 1/2

Use of the electron paramagnetic resonance for the...

3/058/63/000/003/098/104
A059/A101

parameters of the valve and those of the generator grid circuit. For the calibration of the apparatus and its adjustment to maximum sensitivity, the method of loss limitation at the expense of the signal of electron paramagnetic resonance losses in a rock-salt solution is used.

"The Problem of Reinoculation Subsequent to Antitularemia Inoculation," V. S. Sil'chenko

Zhur Mikro, Epid, i Immun, No 6, pp 47-50

As a result of the work of Gayskiy, who developed a dry live tularemia vaccine, and El'bert who developed a liquid live tularemia vaccine, protective inoculation against tularemia became possible. The prophylactic properties of live tularemia vaccines were investigated by Gayskiy, El'bert, Faybich, O.suf'yev, Mayskiy, Tinker, Iuchkova, Altareva, and others. Mass inoculations against tularemia were initiated in the USSR in 1945-46. It has been established on the basis of reactions to tularin and to the vaccine itself) that no reinoculation is necessary for at least 4 years.

Title : The history of vaccination against tularemia

Periodical : Zhur. mikro. epid. i immun. 10, 83-89, Oct 1955

Abstract : A review of past attempts and present achievements by both Soviet and non-Soviet immunologists in the field of tularemia vaccines, both live and killed, is presented. The work of N. A. Gayskiy in this field is the basis of the article. He developed a live tularemia vaccine which has been tested extensively and confers a four year immunity with 97 percent efficiency. The development and testing of other vaccines is also described. 39 Soviet references and 8 non-Soviet references are cited.

Preparation of lubricating oils by hydrogenation of primary tar from Barzoo coals. I. I. B. Rapoport and K. I. Saichenko, *Khim. Tverdogo Topliva* 6, 331-41 (1948).—Low-temp. tar from Barzoo coals was stripped of the fraction b. below 200°. The product had d_4^{20} 0.9569, and contained phenols 2.86 and hairs 0.6%. It was hydrogenated in the presence of MnO_2 and $NaMoO_4$ catalysts. By hydrogenation in autoclaves or in continuous app. at 384–410°, oils similar to those from crude oil can be obtained, although they are not as stable to chem. treatment. The procedure is described and the analytics results are tabulated. Sixteen references. A. A. B.

22

Preparation of lubricating oils by hydrogenation of primary tars II - L. H. Rajagani and L. J. Salschank. *Chem. Technol. Expts.* 7, 48 (1960), 49-51, 20. The use of selective solvents yields oils of very high quality from sapropelite and sapropelite humus fractions and permits the separation of tars into a group of fractions and permits the separation of better quality than compounds. The resulting oils are of higher quality, low viscosity, low percentage of ppt., higher flash point, and higher than oil oils. High boiling fractions of tars contain some aromatic compounds. The primary humus tars also contain a large amt. of aromatic compounds, and selective solvents of the type of $C_{10}H_{14}$ or $C_{11}H_{16}$ have no effect on them. The oils obtained by hydrogenation of humus tars are of lower quality (high acidity and ppt.). Treatment with 30% H_2SO_4 (by wt. of distillate) or destructive hydrogenation does not yield good lubricating oil, but the second treatment yields somewhat better oil than the first. Polymerization with consecutive hydrogenation or destructive hydrogenation is the only good method for prep. of oils. Lighter references A. A. Polgany

Hydrogenation over alloy catalysts at elevated hydrogen pressure. I. Hydrogenation of some aromatic compounds. I. B. Rapoport and E. I. Silchenko. *J. Applied Chem. (U. S. S. R.)* 10, 1427-34 (in French 1434, (1937)).—Tech. naphthalene and phenol were hydrogenated in an autoclave in the presence of various alloy catalysts at an optimal temp. of 200° and at the H₂ pressure of 100 atm. After termination of the reaction the reaction mixt. was cooled and fractionated. The yield of cyclohexane and tetrahydronaphthalene was 85-95%. An increase of the pressure increased the velocity of the hydrogenation, while the coarseness of the catalyst decreased the hydrogenation. The following catalysts were investigated: Ni-Al, Ni-Co-Al, Co-Al, Co-Si and Ni-Co-Si; with the exception of Co-Si, all gave good results. The treatment of the Ni-Co-Al catalyst with KOH yielded a more active catalyst than that treated with NaOH. Twenty-two references. A. A. Podgorny

The reactions carried out over skeleton catalysts at 300-400°. R. I. Sit'chenko, *J. Applied Chem.* (U.S.S.R.) 12, 421 (in French, 437) (1939). Cf. Rapoport and Sit'chenko, *C. A. B.*, 1939. C_6H_6 , PhMe and C_6H_5 Me, were hydrogenated under ordinary pressure and under H pressure in the presence of the Ni-Co-Al catalyst at 180-200°. Hydrogenation without pressure required repetition of the process (2-3 times) for completeness, but under pressure the reaction was complete in 30 min. The methylcyclohexane (I) obtained and decalin (Du Pont) (II) were treated at 300-400° at the usual pressure. Without H, I gives CH_4 and C_6H_6 ; II gives CH_4 , homologs, low-boiling aromatic hydrocarbons and naphthalene. In the presence of H, I gives CH_4 ; II gives none of the above products. The alloy catalysts promoted dehydrogenation and decoupling at 300-400°. The presence of H considerably retarded dehydrogenation but not decoupling, but the H under high pressure completely eliminated both re-

actions; probably under this condition isomerization took place (in the case of decalin). Therefore, the alloy catalysts are very similar to catalysts prep. on asbestos or charcoal.

Effect of oxygen- and nitrogen-containing compounds on the rate of hydrogenation of aromatic hydrocarbons. V. I. Karychev, D. I. Orochko, E. I. Sil'chenko, and N. V. Shavchina. *Khim. i Tekhnol. Topol.* 1936, No. 12, 29-32.

Hydrogenation was carried out under 300 atm. H₂ with WO₃(SO₄)-Ni catalyst at 300-400° in a continuous-fed app. Addn. of phenols to mixts. of aromatic hydrocarbons and heterocyclic compds. had no effect on the rate of hydrogenation. The degree of conversion of hydrocarbons at 320° decreased from 64% to 23% and that of phenol from 80% to 28% in the presence of 7 wt.-% pyridine. Under these conditions the conversion of pyridine was 80-85%. When the temp. was raised to 400°, the conversion of pyridine was

89%, hydrocarbons 60%, phenol 84%. Conversion of benzene at 300° fell, resp., to 73% and 80% in the presence of 1.6% and 6% pyridine. At 300° and 340° the conversion of benzene contg. 4% hydroquinone, resp., decreased by 63% and 70%.

TITLE: Some problems of macroscopic kinetics of hydrogenation of aromatic hydrocarbons in flowing operation

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 4, 1963, 78-79, abstract 4B515 (Tr. Vses. n.-i. in-t po pererabotke nefi i gaza i polucheniya iskusstv. zhidk. topliva, no. 8, 1959, 4-19)

TEXT: In the case of small reaction rates toluene hydrogenation may be formally described by the equation of pseudomonomolecular inhibiting reactions. With high rates the hydrodynamic conditions of the experiment have an effect on the depth of transformation of the crude. A reduction in grain size of the industrial W-Ni catalyst (Cat) on the carrier causes an increase in the macroscopic rate of C_6H_6 hydrogenation, which indicates the inhibiting effect of the diffusion of reagents in the Cat pores. Inhibition is particularly intense in the first stages of hydrogenation, when the surface reaction rate is high. The mean effectiveness of the internal surface of industrial Cat (tablets 10 mm in diam, 10 mm in height)

TITLE:

Isomerization of hydrocarbons from petroleum paraffin
waxes

PERIODICAL: Neftekhimiya, v.1, no.5, 1961, 639-647

TEXT: Results are given of investigation into the isomerization of solid paraffin waxes separated from high-sulphur crudes in refineries. 98.6% of the waxes boiled between 350 and 450°C. Their melting point was 51°C, sulphur content 0.03% and oil content 2%. The waxes were typical commercial waxes with relatively high oil content. Isomerization was conducted in a laboratory flow apparatus under hydrogen pressure. Molten wax at 100°C mixed with hydrogen was fed into the reactor filled with 100 ml of catalyst. The reactor temperature ranged from 390 to 430°C. Industrial platinum catalyst was used. In some of the experiments, 3% wt benzene was added to the wax to elucidate the influence of aromatic hydrocarbons on the processes of chain

Isomerization of hydrocarbons ...

rupture and isomerization. Table 1 gives optimum reaction conditions together with some properties of the products. The presence in the products of isoparaffins is shown by the fact that a considerable lowering of their solidification point occurs after treatment with urea. Three fractions of the products were selectively dewaxed and clay-treated. Yields of the dewaxed oils varied from 82 to 75%, for the fractions boiling between 300 and 350°C, to 38% for the fractions boiling between 400 and 450°C. Solidification temperature for all dewaxed oils varied between -30 and -34°C. The wax separated during dewaxing contained about 90% urea adductable material and therefore is suitable for adding to the feedstock. Isomerization of wax of m.p. 58 to 60°C gives large quantities of paraffins boiling between 350 to 450°C, which have a special interest for oxidation to fatty alcohols and acids. Oils solidifying below -40°C were produced by a two-step dewaxing, the second step consisting of urea treatment. The oils have relatively low viscosities (3.5 to 10.1 cs at 50°C and 2.5 to 3.4 cs at 100°C) and high viscosity indices (115 to 142). Viscosity-gravity constants of the oils are below 0.77; densities lower than Card 2/0/

E075/E484

0.83 and refractive index n_D^{20} less than 1.4660. It is concluded that the oils consist of highly isomerized paraffinic hydrocarbons. The content of aromatic hydrocarbons in the oils varies from 8 to 12%. It is thought that they are mainly homologues of naphthalene. The oils obtained in the experiments in the presence of benzene have almost no resins, whereas the other oils contain 0.5 to 0.7% resins and are somewhat darker. The aromatic hydrocarbons improve oxidation stability of the oils as measured by sludge formation and acid value after testing by method VTI. More viscous oils (SAE 10) were obtained by adding 2% Acryloid 150 and polymethacrylate "D" (obtained in VNII NP) to the oils. The viscosity index is thus increased to 182-187. It is concluded that the isomerization constitutes a possible commercial process for the production of lubricating oils with high viscosity indices. TITLE: Separation of aromatic hydrocarbons by means of complexes

SOURCE: Khimiya i tekhnologiya topliv i masel, ⁷no. 6, 1964, 24-28

TOPIC TAGS: xylene, p-xylene, m-xylene, antimony(III) chloride,
p-xylene separation

ABSTRACT: A study has been made of the separation of p-xylene by means of complex formation with $SbCl_3$ from a mixture of C_8 aromatic hydrocarbons produced in the aromatization of gasoline fractions. The principal purpose was to determine the maximum percentage recovery of p-xylene obtainable. The purity of the isolated p-xylene was also studied. Xylenes, synthetic mixtures of pure p- and m-xylene, and the 136—140C. xylene fraction produced at the Novokuybyshevskiy Refinery were used. $SbCl_3$ was dissolved in the

Card 1/3

ACCESSION NR: AP4039763

hydrocarbon mixture at 60—70C. The solution was cooled to a pre-determined temperature, and a $\text{SbCl}_3 \cdot \text{C}_6\text{H}_4(\text{CH}_3)_2$ crystal seed (mp, 56C) was added. After standing for one hour, the precipitated crystalline complex was filtered off and thermally decomposed at 136—144C. The hydrocarbons were isolated by distillation. Optimum conditions for various stated initial compositions are given in tables. It was concluded that separation of highly concentrated p-xylene is best conducted in a continuous equipment in two or three stages, depending on the starting-material composition, the complex being decomposed between the stages. In this case, 94—96% p-xylene is produced after the last stage. The SbCl_3 can be repeatedly regenerated. The mother liquor can be returned to the first stage and m-xylene can be separated from it by complex formation with SbCl_3 under different conditions. This research was done at the All-Union Scientific Research Institute of the Petroleum Industry. Orig. art. has: 5 tables and 1 figure.

TOPIC TAGS: luminescence spectrum, adiabatic approximation

ABSTRACT: An article by L. REBANE and T. SAAR in the same issue of this
journal establishes the fact that there is a decrease in the half-width of
the vibration sub-band of $KBr-O_2^+$ with an increase in the number n in the
luminescence spectrum. The present article is intended to show that this
fact may be explained as the effect of the interaction of local vibration
with crystal vibrations if the "double adiabatic approximation" is used as
the basis and a certain assumption is made as to the sign of an harmonic
interaction between local and crystal vibrations. The authors note that the
"double adiabatic approximation" is a general approach to the problem of a
comparatively light impurity molecule in a heavy base and is apparently also
effective in the case of any impurity centers if there is a local vibration
with a frequency significantly exceeding the frequency of the remaining
vibrations. The authors state that they hope to return to a detailed con-
sideration of the "double adiabatic approximation" in subsequent publications.

TITLE: On the Accuracy of Different Variants of the Franck-Condon Principle (O tochnosti razlichnykh variantov printsipa Franka-Kondona)

PERIODICAL: Inzhenerno-fizicheskii zhurnal, 1959, Nr 5, pp 60-69 (USSR)

ABSTRACT: The authors consider some problems in the application of the Franck-Condon principle, in particular the distribution of probabilities in electronic-vibrational transitions for vibrational levels with low quantum numbers. The main part of this investigation applies to a harmonic oscillator whose frequency does not change as a result of an electronic transition. In the first part of their paper the authors describe various methods of determining transitional probabilities, namely: the quantum-mechanical one and 3 forms of semi-classical treatment. In the quantum-mechanical treatment, the authors analyze existing formulae for probabilities of transition from the vibrational level of the n-number ground electronic state into that of the m-number excited electronic state. Using a Krivoglaz formulae [Ref 3] they calculate $W(n \rightarrow m)$ for $n = 0, 1$ and 2 for two values of the p_0 - quantity which characterizes Stokes'

On the Accuracy of Different Variants of the Franck-Condon Principle

losses in the number of quanta. The results of calculations are presented in Figures 2 and 3 in the form of the curves in which the $W(m)$ -values are plotted versus m . In the semi-classical treatment, the authors, while retaining a part of the classical Franck-Condon principle formulation, modify another part of it by making allowance for the quantum-mechanical distribution of coordinate. They present 3 different forms of semi-classical treatment: B, B1 and B2. The latter two are based on the paper of Dexter [Ref 12]. The second part of the present investigation deals with the applicability of the semi-classical approximation of the B-type in more detail. This approximation is based on the statement that the quantum-mechanical distribution of coordinates goes over into the classical one with an increase of the number of vibrational levels. Analyzing this statement the authors found that a so-called "energy error" ΔE grows with an increase of the m -number as it is seen from the following relation:

$$|\Delta E| \approx m^{\frac{1}{2}} \hbar \omega$$

TITLE: On the theory of electron-vibrational spectra of
molecules and crystals

PERIODICAL: Akademiya nauk Estonskoy SSR. Izvestiya. Seriya
fiziko-matematicheskikh i tekhnicheskikh nauk,
1960, no. 4, 313-330

TEXT: This paper describes some investigations of electron-vibra-
tional spectra with the method of moments previously used by M.
Lax (Ref. 1: J.Chem.Phys, 20, 1952, 1752). The authors claim that
this method does not suffer from the disadvantages of either the
single-coordinate models or the method of quasi-independent normal
vibrations. First, a simple derivation of equations for the moments
of spectral bands arising as a result of electron-vibrational tran-

sitions is given. The moment S_1 of order C of the spectral band is given by

$$S_1 = \sum_i n_i \sum_s (E_s - E_i)^1 w_{si}. \quad (5)$$

The Franck-Condon factor $w_{si} = \left[\int \psi_{II s}^*(x) M(x) \psi_{I i}(x) dx \right]^2$; n_i is the number of systems in the initial vibrational level, number i ; E_i and E_s are the energies of the initial and final vibrational levels respectively; and $M(x)$ is the electron matrix element; $\psi_{I i}(x)$ and $\psi_{II s}(x)$ are vibrational wave functions in electron states I (initial) and II (final); and x denotes an assembly of all vibrational coordinates; i and s are respectively the collective vibrational quantum numbers. This is transformed into the following relation in terms of the Hamiltonian operators \hat{H}_I and \hat{H}_{II}

Card 2/6

On the theory of electron- ...

$$S_l = \sum_i n_i \sum_{k=0}^l (-1)^k C_l^k \int dx (\psi_i^*(x) M^*(x) \hat{H}_{II}^{l-k} M(x) \hat{H}_I^k \psi_i(x)). \quad (8) \quad (8)$$

whence the respective moments may be calculated. This formula has wide limits of applicability, since the adiabatic approximation is not required for its derivation, the vibrations are not described by normal coordinates, and the distribution of systems among the vibrational levels need not be in thermal equilibrium. The authors now proceed to consider the conditions for mirror symmetry of absorption and radiation bands in electron vibrational transitions, a problem which has already been studied by V.L. Levshin (Ref. 2: Fotolyuminestsentsiya zhidkikh i tverdykh veshchestv (Photoluminescence of Liquid and Solid Media) GITTL, M.-L., 1951, 96). There have been doubts whether the Levshin conditions are the only ones, for which mirror symmetry occurs. The statement of mirror symmetry is expressed as a relation between the moments of the bands which is then written in terms of Eq. (5). The equalities satisfying

this relation are identical with the Levshin conditions. These conditions are examined, and expressed in the form: (i) for the system of the two adiabatic potentials, either a plane of symmetry or a center of symmetry in the dimension (x) must exist; (ii) the distribution function of vibrational levels must be the same in each state; and it is shown that these conditions, in addition to being sufficient, are also necessary for mirror symmetry. Next, the authors calculate the moments of the spectral bands of a harmonic oscillator, whose frequency changes during transitions, on the basis of Eq. (8). Having determined the first four moments of the absorption band, the same moments for the radiation band are derived by making the appropriate substitutions, and the moments for a system of independent harmonic oscillators are also presented. Finally, the relation between the contours of absorption and radiation bands for the case, in which the frequency of vibration changes during transitions, on the basis of Eq. (8). In this case, there is no mirror symmetry. Approximate equations are deduced for

the ratios of the first three moments, which are estimated to be within the accuracy of experimental measurements, the general equation being

$$\frac{S_n^{\alpha}(\epsilon)}{S_n^I(\epsilon)} = (-1)^n \left(\frac{p^{\alpha}}{p^I} \right)^n .$$

The moments are taken relative to the electron transition energy ϵ , the superscripts α and I represent absorption and emission respectively, and p is the Stokes loss for the particular case. It is shown that this approximation may be used for multi-coordinate as well as simple models. There are 1 figure and 22 references: 19 Soviet-bloc and 3 non-Soviet-bloc. TITLE: Calculation of the electron-vibrating spectral band taking anharmonicity of the vibrations into account

PERIODICAL: Referativnyy zhurnal, Fizika, no. 8, 1962, 40, abstract 8V281
("Tr. In-ta fiz. i astron. AN EstSSR", 1961, no. 15, 21 - 29; summary in English) ✓B

TEXT: The first four moments of the probability distribution of electron-vibrating transitions have been calculated in Condon's approximation for the multi-coordinate model of the luminescence center in crystals or molecules. In order to take account of the anharmonicity of the vibrations, the adiabatic potentials of the model are given in the form of expansions in power series including third power terms.
